

# [METHOD FOR ACCESSING REMOTE DATABASE USING A WINDOW PROGRAM]

## Abstract

The present invention discloses a method for accessing remote database using a window program, and more particularly, relates to a method for accessing remote database using a window program that is created after windowizing the SQL syntax. The method for accessing remote database using a window program comprises the steps that are described as follows. Firstly, the user selects a remote database name to be connected via a connect-to-database function in the command list. Secondly, the window program determines whether the user authenticated for entering the remote database or not. If the user is authenticated, the user is allowed to select the SQL command from the SQL instruction area, and thus the selected SQL instruction is then displayed in the display area for further modification. Ultimately, the user utilizes an execute function in the command list to execute the modified SQL instruction and the resulting execution is displayed in the display area by the window program.
